

APPLICATION IMPROVEMENT SUGGESTIONS

Introduction

As part of the QA testing process, several opportunities were identified to improve the application's usability, security, and overall user experience. The following recommendations are based on testing observations and software quality assurance best practices.

Suggestion 1: Implement Real time Input Validation

The application should validate user inputs such as email address, mobile number, and password while the user is typing instead of validating only after the Continue or Sign Up button is clicked.

Benefits

- Provides immediate feedback.
- Reduces invalid submissions.
- Improves user experience.
- Minimizes user errors.

Suggestion 2: Improve Password Security Features

Add a password strength indicator and display password requirements during account creation.

Benefits

- Encourages strong passwords.
- Improves account security.
- Reduces weak password usage.
- Enhances registration experience.

Suggestion 3: Display User-Friendly Error Messages

Replace generic browser validation messages with customized, easy-to-understand messages. Example: 'Please enter a valid email address in the format example@domain.com.'

Benefits

- Easier to understand.
- Faster error correction.
- Better usability.
- Professional interface.

Conclusion

Implementing these improvements will enhance the application's usability, strengthen security, reduce user errors, and provide a smoother login and registration experience. These recommendations can improve overall software quality and customer satisfaction.
