

Task 2 – Defect Report

Bug ID	BUG-001
Bug Title	Application allows users to log in with an invalid email format.
Module	Login
Environment	Windows 11, Google Chrome (Latest Version)
Build Version	Stage Environment
Severity	High
Priority	High
Status	Open
Reported By	Mabitha M
Reported Date	02-07-2026

Description:

The application allows users to continue with the login process even when an invalid email address is entered. The system does not properly validate the email format before processing the request. This behavior may allow incorrect user input, reduce data quality, and create an inconsistent user experience. The application should validate the email format before allowing the user to proceed.

Preconditions:

- The application is accessible.
- The user is on the Login page.
- An active internet connection is available.

Steps to Reproduce:

1. Open the application in Google Chrome.
2. Navigate to the Login page.
3. Enter an invalid email address such as 'abcmal.com'.
4. Click the Continue button.
5. Observe the application behavior.

Expected Result:

The application should validate the email format and display an appropriate validation message. The user should not be allowed to proceed to the next step until a valid email address is entered.

Actual Result:

The application accepts the invalid email address and allows the user to proceed to the next step without displaying any validation message.

Impact:

Users can submit incorrectly formatted email addresses, which may lead to authentication failures, poor data integrity, and an inconsistent user experience.

Test Data:

Invalid Email: abcgmail.com

Recommendation:

Implement proper client-side and server-side email format validation. The application should prevent users from proceeding until a valid email address is entered and should display a clear validation message explaining the issue.
